

TURN WATER DATA INTO ACTIONABLE INSIGHTS

How? With Honeywell Forge Performance+ for Utilities, a digital platform that enhances asset awareness and resource management.

As water flows in many directions to many destinations, smart meters allow utilities to track how, when and where it moves. Metrics like consumption, flow rate, pressure, time-of-use data and backflow are captured, stored and monitored to help ensure a consistent, safe supply.

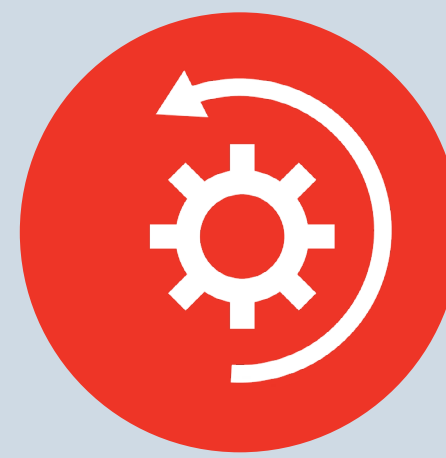

With Honeywell Forge Performance+ for Utilities, water utilities can visualise and utilise this meter data – across an entire network – with greater efficiency. This end-to-end solution for utilities:

Provides a complete and organised view of all assets and resources, including smart meters and communication modules

Helps unify data and, with its data-driven recommendation engine, alerts utilities in real time if any measurement is abnormal, prompting quick action

Uses past and current data to identify operational trends and forecasts how to improve water distribution over time

Can track meter health and device outages that may occur to help prevent operational downtime

Honeywell Forge Performance+ for Utilities is the solution water utilities need to measure, monitor and manage our world's most precious resource more effectively.
